

# Package ‘tidyHeatmap’

February 8, 2025

**Type** Package

**Title** A Tidy Implementation of Heatmap

**Version** 1.11.6

**Maintainer** Stefano Mangiola <mangiolastefano@gmail.com>

**Description** This is a tidy implementation for heatmap. At the moment it is based on the (great) package 'ComplexHeatmap'. The goal of this package is to interface a tidy data frame with this powerful tool. Some of the advantages are: Row and/or columns colour annotations are easy to integrate just specifying one parameter (column names). Custom grouping of rows is easy to specify providing a grouped tbl. For example: `df %>% group_by(...)`. Labels size adjusted by row and column total number. Default use of Brewer and Viridis palettes.

**License** GPL-3

**URL** <https://www.r-project.org>,  
<https://github.com/stemangiola/tidyHeatmap>

**BugReports** <https://github.com/stemangiola/tidyHeatmap/issues>

**Depends** R (>= 4.3.0)

**Imports** methods, stats, utils, dplyr (>= 0.8.5), magrittr (>= 1.5),  
tidyr (>= 1.0.3), rlang (>= 0.4.5), purrr (>= 0.3.3), tibble,  
ComplexHeatmap (>= 2.2.0), viridis (>= 0.5.1), circlize (>= 0.4.8), RColorBrewer (>= 1.1), grid, grDevices, lifecycle (>= 0.2.0), dendextend, patchwork

**Suggests** spelling, testthat, vdiff, BiocManager, knitr, rmarkdown,  
qpdf, covr, roxygen2, forcats, ggplot2

**VignetteBuilder** knitr

**RdMacros** lifecycle

**Biarch** true

**biocViews** AssayDomain, Infrastructure

**Encoding** UTF-8

**LazyData** true  
**RoxygenNote** 7.3.2  
**Language** en-US  
**NeedsCompilation** no  
**Author** Stefano Mangiola [aut, cre],  
 Anthony Papenfuss [ctb]  
**Repository** CRAN  
**Date/Publication** 2025-02-08 04:20:02 UTC

add_annotation	<i>add_annotation</i>
----------------	-----------------------

---

## Description

add\_annotation() takes a tbl object and easily produces a ComplexHeatmap plot, with integration with tibble and dplyr frameworks.

## Usage

```
add_annotation(
  my_input_heatmap,
  annotation,
  type = rep("tile", length(quo_names(annotation))),
  palette_discrete = list(),
  palette_continuous = list(),
  size = NULL,
  ...
)
```

## Arguments

my_input_heatmap	A 'InputHeatmap' formatted as  <SAMPLE>  <TRANSCRIPT>  <COUNT>  <...>
annotation	Vector of quotes
type	A character vector of the set c("\tile", "\point", "\bar", "\line")

palette_discrete	A list of character vectors. This is the list of palettes that will be used for horizontal and vertical discrete annotations. The discrete classification of annotations depends on the column type of your input tibble (e.g., character and factor).
palette_continuous	A list of character vectors. This is the list of palettes that will be used for horizontal and vertical continuous annotations. The continuous classification of annotations depends on the column type of your input tibble (e.g., integer, numerical, double).
size	A grid::unit object, e.g. unit(2, "cm"). This is the height or width of the annotation depending on the orientation.
...	The arguments that will be passed to top_annotation or left_annotation of the ComplexHeatmap container

### Details

To be added.

### Value

A ‘ComplexHeatmap’ object

### Source

[Mangiola and Papenfuss., 2020](<https://joss.theoj.org/papers/10.21105/joss.02472>)

### References

Mangiola, S. and Papenfuss, A.T., 2020. "tidyHeatmap: an R package for modular heatmap production based on tidy principles." Journal of Open Source Software. doi:10.21105/joss.02472.

---

add_attr	<i>Add attribute to object</i>
----------	--------------------------------

---

### Description

Add attribute to object

### Usage

```
add_attr(var, attribute, name)
```

### Arguments

var	A tibble
attribute	An object
name	A character name of the attribute

**Value**

A tibble with an additional attribute

---

add_bar	<i>DEPRECATED. Adds a bar annotation layer to a 'InputHeatmap', that on evaluation creates a 'ComplexHeatmap'</i>
---------	---

---

**Description**

add\_bar() from a 'InputHeatmap' object, adds a bar annotation layer.

add\_bar() from a 'InputHeatmap' object, adds a bar annotation layer.

**Usage**

```
add_bar(.data, .column, palette = NULL, size = NULL, ...)
```

```
add_bar(.data, .column, palette = NULL, size = NULL, ...)
```

```
## S4 method for signature 'InputHeatmap'
```

```
add_bar(.data, .column, palette = NULL, size = NULL, ...)
```

**Arguments**

.data	A 'tbl_df' formatted as   <ELEMENT>   <FEATURE>   <VALUE>   <...>
.column	Vector of quotes
palette	A character vector of colors, or a function such as colorRamp2 (see examples).
size	A grid::unit object, e.g. unit(2, "cm"). This is the height or width of the annotation depending on the orientation.
...	The arguments that will be passed to top_annotation or left_annotation of the ComplexHeatmap container

**Details****[Maturing]**

It uses 'ComplexHeatmap' as visualisation tool.

**[Maturing]**

It uses 'ComplexHeatmap' as visualisation tool.

**Value**

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

**Source**

```
print("DEPRECATED")
```

```
print("DEPRECATED")
```

---

add_class	<i>Add class to object</i>
-----------	----------------------------

---

**Description**

Add class to object

**Usage**

```
add_class(var, name)
```

**Arguments**

var	A tibble
name	A character name of the attribute

**Value**

A tibble with an additional attribute

---

add_line	<i>DEPRECATED. Adds a line annotation layer to a 'InputHeatmap', that on evaluation creates a 'ComplexHeatmap'</i>
----------	--

---

### Description

add\_line() from a 'InputHeatmap' object, adds a line annotation layer.

### Usage

```
add_line(.data, .column, palette = NULL, size = NULL, ...)
```

```
## S4 method for signature 'InputHeatmap'
add_line(.data, .column, palette = NULL, size = NULL, ...)
```

### Arguments

.data	A 'tbl_df' formatted as   <ELEMENT>   <FEATURE>   <VALUE>   <...>
.column	Vector of quotes
palette	A character vector of colors, or a function such as colorRamp2 (see examples).
size	A grid::unit object, e.g. unit(2, "cm"). This is the height or width of the annotation depending on the orientation.
...	The arguments that will be passed to top_annotation or left_annotation of the ComplexHeatmap container

### Details

#### [Maturing]

It uses 'ComplexHeatmap' as visualisation tool.

### Value

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

**Examples**

```
print("DEPRECATED")
```

---

add_point	<i>DEPRECATED. Adds a point annotation layer to a 'InputHeatmap', that on evaluation creates a 'ComplexHeatmap'</i>
-----------	---

---

**Description**

add\_point() from a 'InputHeatmap' object, adds a point annotation layer.

**Usage**

```
add_point(.data, .column, palette = NULL, size = NULL, ...)
```

```
## S4 method for signature 'InputHeatmap'
add_point(.data, .column, palette = NULL, size = NULL, ...)
```

**Arguments**

.data	A 'tbl_df' formatted as   <ELEMENT>   <FEATURE>   <VALUE>   <...>
.column	Vector of quotes
palette	A character vector of colors, or a function such as colorRamp2 (see examples).
size	A grid::unit object, e.g. unit(2, "cm"). This is the height or width of the annotation depending on the orientation.
...	The arguments that will be passed to top_annotation or left_annotation of the ComplexHeatmap container

**Details****[Maturing]**

It uses 'ComplexHeatmap' as visualisation tool.

**Value**

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

## Examples

```
print("DEPRECATED")
```

---

add_tile	<i>DEPRECATED. Adds a tile annotation layer to a 'InputHeatmap', that on evaluation creates a 'ComplexHeatmap'</i>
----------	--

---

## Description

add\_tile() from a 'InputHeatmap' object, adds a tile annotation layer.

## Usage

```
add_tile(.data, .column, palette = NULL, size = NULL, ...)
```

```
## S4 method for signature 'InputHeatmap'
```

```
add_tile(.data, .column, palette = NULL, size = NULL, ...)
```

## Arguments

.data	A 'tbl_df' formatted as  <ELEMENT> <FEATURE> <VALUE> <...>
.column	Vector of quotes
palette	A character vector of colors, or a function such as colorRamp2 (see examples).
size	A grid::unit object, e.g. unit(2, "cm"). This is the height or width of the annotation depending on the orientation.
...	The arguments that will be passed to top_annotation or left_annotation of the ComplexHeatmap container

## Details

### [Maturing]

It uses 'ComplexHeatmap' as visualisation tool.

## Value

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

**Examples**

```
hm =
  tidyHeatmap::N52 |>
  tidyHeatmap::heatmap(
    .row = symbol_ct,
    .column = UBR,
    .value = `read count normalised log`
  )

hm |> annotation_bar(inflexion)
```

---

annotation_line	<i>Adds a line annotation layer to a 'InputHeatmap', that on evaluation creates a 'ComplexHeatmap'</i>
-----------------	--

---

**Description**

annotation\_line() from a 'InputHeatmap' object, adds a line annotation layer.

**Usage**

```
annotation_line(.data, .column, palette = NULL, size = NULL, ...)

## S4 method for signature 'InputHeatmap'
annotation_line(.data, .column, palette = NULL, size = NULL, ...)
```

**Arguments**

.data	a 'InputHeatmap' object created calling 'tidyHeatmap::heatmap()'
.column	Vector of quotes
palette	A character vector of colors, or a function such as colorRamp2 (see examples).
size	A grid::unit object, e.g. unit(2, "cm"). This is the height or width of the annotation depending on the orientation.
...	The arguments that will be passed to <a href="#">anno_lines</a> and <a href="#">HeatmapAnnotation</a> if you want to fine tune the aesthetics.

## Details

### [Maturing]

It uses ‘ComplexHeatmap’ as visualisation tool.

## Value

A ‘InputHeatmap’ object that gets evaluated to a ‘ComplexHeatmap’

A ‘InputHeatmap’ object that gets evaluated to a ‘ComplexHeatmap’

## Source

[Mangiola and Papenfuss., 2020](<https://joss.theoj.org/papers/10.21105/joss.02472>)

## References

Mangiola, S. and Papenfuss, A.T., 2020. "tidyHeatmap: an R package for modular heatmap production based on tidy principles." Journal of Open Source Software. doi:10.21105/joss.02472.

## Examples

```
hm =
  tidyHeatmap::N52 |>
  tidyHeatmap::heatmap(
    .row = symbol_ct,
    .column = UBR,
    .value = `read count normalised log`
  )

hm |> annotation_line(inflexion)
```

---

annotation_numeric	<i>Adds a numeric annotation layer to an ‘InputHeatmap’, that on evaluation creates a ‘ComplexHeatmap’</i>
--------------------	--

---

## Description

‘annotation\_numeric()’ from an ‘InputHeatmap’ object adds a numeric annotation layer.

**Usage**

```

annotation_numeric(
  .data,
  .column,
  palette = NULL,
  size = NULL,
  labels_format = function(x) sprintf("%.1f", x),
  ...
)

## S4 method for signature 'InputHeatmap'
annotation_numeric(
  .data,
  .column,
  palette = NULL,
  size = NULL,
  labels_format = function(x) sprintf("%.1f", x),
  ...
)

```

**Arguments**

.data	A ‘tbl_df’ formatted as   <ELEMENT>   <FEATURE>   <VALUE>   <...>
.column	Vector of quotes
palette	A character vector of colours, or a function such as <code>colorRamp2</code> (see examples).
size	A <code>grid::unit</code> object, e.g. <code>unit(2, "cm")</code> . This is the height or width of the annotation depending on the orientation.
labels_format	A function to format the numeric labels. By default, it formats numbers to two decimal places using ‘ <code>sprintf("</code> supply any function that takes a numeric vector and returns a character vector for customised formatting.
...	The arguments that will be passed to <code>anno_numeric</code> and <code>HeatmapAnnotation</code> if you want to fine tune the aesthetics.

**Details****[Maturing]**

It uses ‘ComplexHeatmap’ as the visualisation tool.

**Value**

An ‘InputHeatmap’ object that gets evaluated to a ‘ComplexHeatmap’.

An ‘InputHeatmap’ object that gets evaluated to a ‘ComplexHeatmap’.

## Examples

```
hm =
  tidyHeatmap::N52 |>
  tidyHeatmap::heatmap(
    .row = symbol_ct,
    .column = UBR,
    .value = `read count normalised log`
  )

hm |> annotation_numeric(inflexion)

# Align to the right
hm |> annotation_numeric(inflexion, align_to = "right")
```

---

annotation_point	<i>Adds a point annotation layer to a 'InputHeatmap', that on evaluation creates a 'ComplexHeatmap'</i>
------------------	---

---

## Description

annotation\_point() from a 'InputHeatmap' object, adds a point annotation layer.

## Usage

```
annotation_point(.data, .column, palette = NULL, size = NULL, ...)

## S4 method for signature 'InputHeatmap'
annotation_point(.data, .column, palette = NULL, size = NULL, ...)
```

## Arguments

.data	a 'InputHeatmap' object created calling 'tidyHeatmap::heatmap()'
.column	Vector of quotes
palette	A character vector of colors, or a function such as colorRamp2 (see examples).
size	A grid::unit object, e.g. unit(2, "cm"). This is the height or width of the annotation depending on the orientation.
...	The arguments that will be passed to <a href="#">anno_points</a> and <a href="#">HeatmapAnnotation</a> if you want to fine tune the aesthetics.

**Details****[Maturing]**

It uses ‘ComplexHeatmap’ as visualisation tool.

**Value**

A ‘InputHeatmap’ object that gets evaluated to a ‘ComplexHeatmap’

A ‘InputHeatmap’ object that gets evaluated to a ‘ComplexHeatmap’

**Source**

    .column = UBR,
    .value = `read count normalised log`
  )

hm |> annotation_tile(CAPRA_TOTAL)

hm |>
  annotation_tile(
    inflection,
    palette = circlize::colorRamp2(c(0, 3,10), c("white", "green", "red"))
  )

```

---

annot_to_list	<i>annot_to_list</i>
---------------	----------------------

---

**Description**

annot\_to\_list

**Usage**

```
annot_to_list(.data)
```

**Arguments**

.data            A data frame

**Value**

A list

---

as_ComplexHeatmap	<i>Creates a 'ComplexHeatmap' object for less standard plot manipulation (e.g. changing legend position)</i>
-------------------	--

---

**Description**

as\_ComplexHeatmap() takes a 'InputHeatmap' object and produces a 'Heatmap' object

**Usage**

```
as_ComplexHeatmap(tidyHeatmap)
```

```
## S4 method for signature 'InputHeatmap'
as_ComplexHeatmap(tidyHeatmap)
```

**Arguments**

tidyHeatmap      A 'InputHeatmap' object from tidyHeatmap::heatmap() call

**Details**

**[Maturing]**

**Value**

A 'ComplexHeatmap'

  .column = UBR,
  .value = `read count normalised log`,
) |>
as_ComplexHeatmap()
```

---

as\_matrix

*Get matrix from tibble*

---

## Description

Get matrix from tibble

## Usage

```
as_matrix(tbl, rownames = NULL, do_check = TRUE)
```

## Arguments

tbl	A tibble
rownames	A character string of the rownames
do_check	A boolean

## Value

A matrix

---

check\_if\_counts\_is\_na *Check whether there are NA counts*

---

**Description**

Check whether there are NA counts

**Usage**

```
check_if_counts_is_na(.data, .abundance)
```

**Arguments**

.data            A tibble of read counts  
.abundance      A character name of the read count column

**Value**

A tbl

---

check\_if\_duplicated\_genes  
*Check whether there are duplicated genes/transcripts*

---

**Description**

Check whether there are duplicated genes/transcripts

**Usage**

```
check_if_duplicated_genes(.data, .sample, .transcript, .abundance)
```

**Arguments**

.data            A tibble of read counts  
.sample          A character name of the sample column  
.transcript      A character name of the transcript/gene column  
.abundance      A character name of the read count column

**Value**

A tbl

---

check\_if\_wrong\_input    *Check whether there are NA counts*

---

**Description**

Check whether there are NA counts

**Usage**

```
check_if_wrong_input(.data, list_input, expected_type)
```

**Arguments**

.data            A tibble of read counts  
list\_input       A list  
expected\_type    A character string

**Value**

A tbl

---

drop\_class            *Remove class to object*

---

**Description**

Remove class to object

**Usage**

```
drop_class(var, name)
```

**Arguments**

var                A tibble  
name               A character name of the class

**Value**

A tibble with an additional attribute

---

`error_if_log_transformed`*Check whether a numeric vector has been log transformed*

---

**Description**

Check whether a numeric vector has been log transformed

**Usage**

```
error_if_log_transformed(x, .abundance)
```

**Arguments**

<code>x</code>	A numeric vector
<code>.abundance</code>	A character name of the transcript/gene abundance column

**Value**

NA

---

`get_abundance_norm_if_exists`*Get column names either from user or from attributes*

---

**Description**

Get column names either from user or from attributes

**Usage**

```
get_abundance_norm_if_exists(.data, .abundance)
```

**Arguments**

<code>.data</code>	A tibble
<code>.abundance</code>	A character name of the abundance column

**Value**

A list of column enquo or error

---

get_elements	<i>Get column names either from user or from attributes</i>
--------------	---

---

**Description**

Get column names either from user or from attributes

**Usage**

```
get_elements(.data, .element, of_samples = TRUE)
```

**Arguments**

.data	A tibble
.element	A character name of the sample column
of_samples	A boolean

**Value**

A list of column enquo or error

---

get_elements_features	<i>Get column names either from user or from attributes</i>
-----------------------	---

---

**Description**

Get column names either from user or from attributes

**Usage**

```
get_elements_features(.data, .element, .feature, of_samples = TRUE)
```

**Arguments**

.data	A tibble
.element	A character name of the sample column
.feature	A character name of the transcript/gene column
of_samples	A boolean

**Value**

A list of column enquo or error

---

`get_elements_features_abundance`*Get column names either from user or from attributes*

---

**Description**

Get column names either from user or from attributes

**Usage**

```
get_elements_features_abundance(  
  .data,  
  .element,  
  .feature,  
  .abundance,  
  of_samples = TRUE  
)
```

**Arguments**

<code>.data</code>	A tibble
<code>.element</code>	A character name of the sample column
<code>.feature</code>	A character name of the transcript/gene column
<code>.abundance</code>	A character name of the read count column
<code>of_samples</code>	A boolean

**Value**

A list of column enquo or error

---

`get_sample_counts`*Get column names either from user or from attributes*

---

**Description**

Get column names either from user or from attributes

**Usage**

```
get_sample_counts(.data, .sample, .abundance)
```

**Arguments**

<code>.data</code>	A tibble
<code>.sample</code>	A character name of the sample column
<code>.abundance</code>	A character name of the read count column

**Value**

A list of column enquo or error

---

get\_sample\_transcript *Get column names either from user or from attributes*

---

**Description**

Get column names either from user or from attributes

**Usage**

```
get_sample_transcript(.data, .sample, .transcript)
```

**Arguments**

.data	A tibble
.sample	A character name of the sample column
.transcript	A character name of the transcript/gene column

**Value**

A list of column enquo or error

---

get\_sample\_transcript\_counts  
*Get column names either from user or from attributes*

---

**Description**

Get column names either from user or from attributes

**Usage**

```
get_sample_transcript_counts(.data, .sample, .transcript, .abundance)
```

**Arguments**

.data	A tibble
.sample	A character name of the sample column
.transcript	A character name of the transcript/gene column
.abundance	A character name of the read count column

**Value**

A list of column enquo or error

---

```
get_x_y_annotation_columns
      get_x_y_annotation_columns
```

---

**Description**

get\_x\_y\_annotation\_columns

**Usage**

```
get_x_y_annotation_columns(.data, .column, .row, .abundance)
```

**Arguments**

.data	A 'tbl' formatted as  <SAMPLE> <TRANSCRIPT> <COUNT> <...>
.column	The name of the column horizontally presented in the heatmap
.row	The name of the column vertically presented in the heatmap
.abundance	The name of the transcript/gene abundance column

**Value**

A list

---

heatmap	<i>Creates a 'InputHeatmap' object from 'tbl_df' on evaluation creates a 'ComplexHeatmap'</i>
---------	---

---

**Description**

heatmap() takes a tbl object and easily produces a ComplexHeatmap plot, with integration with tibble and dplyr frameworks.

**Usage**

```
heatmap(
  .data,
  .row,
  .column,
  .value,
  transform = NULL,
  scale = "none",
  palette_value = c("#440154FF", "#21908CFF", "#fefada"),
  palette_grouping = list(),
  .scale = NULL,
  ...
)
```

```

)

heatmap_(
  .data,
  .row,
  .column,
  .value,
  transform = NULL,
  scale = "none",
  palette_value = c("#440154FF", "#21908CFF", "#fefada"),
  palette_grouping = list(),
  .scale = NULL,
  ...
)

## S4 method for signature 'tbl'
heatmap(
  .data,
  .row,
  .column,
  .value,
  transform = NULL,
  scale = "none",
  palette_value = c("#440154FF", "#21908CFF", "#fefada"),
  palette_grouping = list(),
  .scale = NULL,
  ...
)

## S4 method for signature 'tbl_df'
heatmap(
  .data,
  .row,
  .column,
  .value,
  transform = NULL,
  scale = "none",
  palette_value = c("#440154FF", "#21908CFF", "#fefada"),
  palette_grouping = list(),
  .scale = NULL,
  ...
)

```

### Arguments

<code>.data</code>	A 'tbl_df' formatted as  <.row> <.column> <.value> <...>
<code>.row</code>	The name of the column vertically presented in the heatmap
<code>.column</code>	The name of the column horizontally presented in the heatmap

<code>.value</code>	The name of the column for the value of the element/feature pair
<code>transform</code>	A function, used to transform <code>.value</code> row-wise (e.g., <code>transform = log1p</code> )
<code>scale</code>	A character string. Possible values are <code>c("none", "row", "column", "both")</code>
<code>palette_value</code>	A character vector This is the palette that will be used as gradient for <code>.value</code> . For example <code>c("red", "white", "blue")</code> . For higher flexibility you can use <code>circlize::colorRamp2(c(-2, -1, 0, 1, 2))</code> , <code>viridis::magma(5)</code>
<code>palette_grouping</code>	A list of character vectors. This is the list of palettes that will be used for grouping. For example <code>list(RColorBrewer::brewer.pal(8, "Accent"))</code> or <code>list(c("#B3E2CD", "#FDCDAC", "#CBD5E8"))</code> or <code>list(c("black", "red"))</code>
<code>.scale</code>	DEPRECATED. please use <code>scale</code> instead ( with no dot prefix )
<code>...</code>	The arguments that will be passed to the <code>Heatmap</code> function of <code>ComplexHeatmap</code> backend

## Details

### [Maturing]

This function takes a `tbl` as an input and creates a ‘ComplexHeatmap’ plot. The information is stored in a ‘InputHeatmap’ object that is updated along the pipe statement, for example adding annotation layers.

## Value

A ‘InputHeatmap’ objects that gets evaluated to a ‘ComplexHeatmap’ object

A ‘InputHeatmap’ object

A ‘InputHeatmap’ object

A ‘InputHeatmap’ object

## Source

[Mangiola and Papenfuss., 2020](<https://joss.theoj.org/papers/10.21105/joss.02472>)

## References

Mangiola, S. and Papenfuss, A.T., 2020. "tidyHeatmap: an R package for modular heatmap production based on tidy principles." *Journal of Open Source Software*. doi:10.21105/joss.02472.

## Examples

```
tidyHeatmap::N52 |>
  dplyr::group_by( `Cell type` ) |>
  tidyHeatmap::heatmap(
    .row = symbol_ct,
    .column = UBR,
    .value = `read count normalised log`,
  )
```

---

ifelse2_pipe	<i>This is a generalisation of ifelse that accepts an object and return an objects</i>
--------------	--

---

**Description**

This is a generalisation of ifelse that accepts an object and return an objects

**Usage**

```
ifelse2_pipe(.x, .p1, .p2, .f1, .f2, .f3 = NULL)
```

**Arguments**

.x	A tibble
.p1	A boolean
.p2	ELSE IF condition
.f1	A function
.f2	A function
.f3	A function

**Value**

A tibble

---

ifelse_pipe	<i>This is a generalisation of ifelse that accepts an object and return an objects</i>
-------------	--

---

**Description**

This is a generalisation of ifelse that accepts an object and return an objects

**Usage**

```
ifelse_pipe(.x, .p, .f1, .f2 = NULL)
```

**Arguments**

.x	A tibble
.p	A boolean
.f1	A function
.f2	A function

**Value**

A tibble

---

input_heatmap	<i>input_heatmap</i>
---------------	----------------------

---

**Description**

input\_heatmap() takes a tbl object and easily produces a ComplexHeatmap plot, with integration with tibble and dplyr frameworks.

**Usage**

```
input_heatmap(
  .data,
  .horizontal,
  .vertical,
  .abundance,
  transform = NULL,
  scale = "none",
  palette_value = c("#440154FF", "#21908CFF", "#fefada"),
  palette_grouping = list(),
  ...
)
```

**Arguments**

.data	A 'tbl' formatted as  <SAMPLE> <TRANSCRIPT> <COUNT> <...>
.horizontal	The name of the column horizontally presented in the heatmap
.vertical	The name of the column vertically presented in the heatmap
.abundance	The name of the transcript/gene abundance column
transform	A function, used to transform .value, for example log1p
scale	A character string. Possible values are c("\none\", \"row\", \"column\", \"both\")
palette_value	A character vector, or a function for higher customisation (colorRamp2). This is the palette that will be used as gradient for abundance. If palette_value is a vector of hexadecimal colours, it should have 3 values. If you want more customisation, you can pass to palette_value a function, that is derived as for example 'colorRamp2(c(-2, 0, 2), palette_value)'
palette_grouping	A list of character vectors. This is the list of palettes that will be used for grouping
...	Further arguments to be passed to ComplexHeatmap::Heatmap

**Details**

To be added.

**Value**

A ‘ComplexHeatmap’ object

**Source**

[Mangiola and Papenfuss., 2020](https://joss.theoj.org/papers/10.21105/joss.02472)

---

layer_arrow_down	<i>Adds a layers of symbols above the heatmap tiles to a ‘InputHeatmap’, that on evaluation creates a ‘ComplexHeatmap’</i>
------------------	--

---

**Description**

layer\_arrow\_down() from a ‘InputHeatmap’ object, adds a bar annotation layer.

**Usage**

```
layer_arrow_down(.data, ..., .size = NULL)
```

```
## S4 method for signature 'InputHeatmap'
layer_arrow_down(.data, ..., .size = NULL)
```

**Arguments**

.data	A ‘InputHeatmap’
...	Expressions that return a logical value, and are defined in terms of the variables in .data. If multiple expressions are included, they are combined with the & operator. Only rows for which all conditions evaluate to TRUE are kept.
.size	A column name or a double. The size of the elements of the layer.

**Details****[Maturing]**

It uses ‘ComplexHeatmap’ as visualisation tool.

**Value**

A ‘InputHeatmap’ object that gets evaluated to a ‘ComplexHeatmap’

A ‘InputHeatmap’ object that gets evaluated to a ‘ComplexHeatmap’

**Examples**

```
hm =
  tidyHeatmap::N52 |>
  tidyHeatmap::heatmap(
    .row = symbol_ct,
    .column = UBR,
    .value = `read count normalised log`
  )

hm |> layer_arrow_down()
```

---

layer_arrow_up	<i>Adds a layers of symbols above the heatmap tiles to a ‘InputHeatmap’, that on evaluation creates a ‘ComplexHeatmap’</i>
----------------	--

---

**Description**

layer\_arrow\_up() from a ‘InputHeatmap’ object, adds a bar annotation layer.

**Usage**

```
layer_arrow_up(.data, ..., .size = NULL)

## S4 method for signature 'InputHeatmap'
layer_arrow_up(.data, ..., .size = NULL)
```

## Arguments

<code>.data</code>	A 'InputHeatmap'
<code>...</code>	Expressions that return a logical value, and are defined in terms of the variables in <code>.data</code> . If multiple expressions are included, they are combined with the <code>&amp;</code> operator. Only rows for which all conditions evaluate to TRUE are kept.
<code>.size</code>	A column name or a double. The size of the elements of the layer.

## Details

**Examples**

```
tidyHeatmap::heatmap(
  dplyr::group_by(tidyHeatmap::pasilla,location, type),
  .column = sample,
  .row = symbol,
  .value = `count normalised adjusted`,
) |>
save_pdf(tempfile())
```

---

save\_pdf,Heatmap-method

*save\_pdf*

---

**Description**

save\_pdf

**Usage**

```
## S4 method for signature 'Heatmap'
save_pdf(
  .heatmap,
  filename,
  width = NULL,
  height = NULL,
  units = c("in", "cm", "mm")
)
```

**Arguments**

.heatmap	A 'Heatmap'
filename	A character string. The name of the output file/path
width	A 'double'. Plot width
height	A 'double'. Plot height
units	A character string. units ("in", "cm", or "mm")

---

```
save_pdf,InputHeatmap-method
      save_pdf
```

---

**Description**

save\_pdf

**Usage**

```
## S4 method for signature 'InputHeatmap'
save_pdf(
  .heatmap,
  filename,
  width = NULL,
  height = NULL,
  units = c("in", "cm", "mm")
)
```

**Arguments**

.heatmap	A 'Heatmap'
filename	A character string. The name of the output file/path
width	A 'double'. Plot width
height	A 'double'. Plot height
units	A character string. units ("in", "cm", or "mm")

---

```
scale_robust      Scale counts in a robust way against sd == 0
```

---

**Description**

Scale counts in a robust way against  $sd == 0$

**Usage**

```
scale_robust(y)
```

**Arguments**

y	A numerical array
---	-------------------

**Value**

A scaled and centred numerical array

**Source**

---

select\_closest\_pairs    *Sub function of remove\_redundancy\_elements\_though\_reduced\_dimensions*

---

**Description**

Sub function of remove\_redundancy\_elements\_though\_reduced\_dimensions

**Usage**

```
select_closest_pairs(df)
```

**Arguments**

df                    A tibble

**Value**

A tibble with pairs to drop

---

split\_rows                    *Split the heatmap row-wise depending on the biggest branches in the cladogram.*

---

**Description**

split\_rows() from a 'InputHeatmap' object, split the row cladogram.

split\_columns() from a 'InputHeatmap' object, split the column cladogram.

**Usage**

```
split_rows(.data, number_of_groups)
```

```
## S4 method for signature 'InputHeatmap'
split_rows(.data, number_of_groups)
```

```
split_columns(.data, number_of_groups)
```

```
## S4 method for signature 'InputHeatmap'
split_columns(.data, number_of_groups)
```

**Arguments**

`.data` A 'InputHeatmap'  
`number_of_groups` An integer. The number of groups to split the cladogram into.

**Details****[Maturing]**

It uses 'ComplexHeatmap' as visualisation tool.

**[Maturing]**

It uses 'ComplexHeatmap' as visualisation tool.

**Value**

A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'  
 A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'  
 A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'  
 A 'InputHeatmap' object that gets evaluated to a 'ComplexHeatmap'

**Examples**

```
hm =
  tidyHeatmap::N52 |>
  tidyHeatmap::heatmap(
    .row = symbol_ct,
    .column = UBR,
    .value = `read count normalised log`
  )
```

```
hm |> split_rows(2)
```

```
hm =
```

```

tidyHeatmap::N52 |>
tidyHeatmap::heatmap(
  .row = symbol_ct,
  .column = UBR,
  .value = `read count normalised log`
)

hm |> split_columns(2)

```

---

wrap_heatmap	<i>Wrap tidyHeatmap (ComplexHeatmap) in a patchwork-compliant patch</i>
--------------	---

---

## Description

In order to add tidyHeatmap (ComplexHeatmap) element to a patchwork they can be converted to a compliant representation using the 'wrap\_heatmap()' function. This allows you to position either grobs, ggplot objects, patchwork objects, or even base graphics (if passed as a formula) in either the full area, the full plotting area (anything between and including the axis label), or the panel area (only the actual area where data is drawn).

## Usage

```

wrap_heatmap(
  panel = NULL,
  plot = NULL,
  full = NULL,
  clip = TRUE,
  ignore_tag = FALSE,
  padding = NULL
)

## S4 method for signature 'InputHeatmap'
wrap_heatmap(
  panel = NULL,
  plot = NULL,
  full = NULL,
  clip = TRUE,
  ignore_tag = FALSE,
  padding = NULL
)

```

## Arguments

panel, plot, full

A grob, ggplot, patchwork, formula, raster, or nativeRaster object to add to the respective area.

clip	Should the grobs be clipped if expanding outside its area
ignore_tag	Should tags be ignored for this patch. This is relevant when using automatic tagging of plots and the content of the patch does not qualify for a tag.
padding	A <code>grid::unit</code> object. It defined the padding distance for the plot. It is helpful when the heatmap is assembled with other ggplots through patchwork.

**Value**

A wrapped\_patch object

A wrapped\_patch object
